Project Features

1. AI in Auditing

[Explain the feature, what is the focus of the feature and what processes are to be done]

1.1.Business Process 1

*[Explain the business process that would occur, **note**: there should be more than one business process for a feature]*

2.2.1 Auditing Process

The auditing process is a structured and systematic approach used to evaluate the accuracy, completeness, and reliability of an organization's financial and operational data Alqudah et al. (2023); Mentz, Barac, and Odendaal (2018). It ensures that stakeholders can rely on financial statements and internal reports. The process generally consists of three main phases: audit planning, evidence collection and evaluation, and conclusion formation with reporting. When these phases are properly executed, they enhance audit quality, support compliance with professional standards, and improve the effectiveness of both internal and external audits Alqudah et al. (2023); Mentz et al. (2018).

2.2.1.1 Planning the Audit

Audit planning is the first and one of the most critical stages in the auditing

process Mentz et al. (2018). It involves obtaining sufficient understanding of the organization's activities, internal control environment, and risks associated with financial reporting Mentz et al. (2018). Effective planning includes developing a structured audit evidence plan that defines procedures, areas of focus, and the type and extent of evidence required Mentz et al. (2018). This enables auditors to allocate resources efficiently and concentrate on high-risk areas, increasing the likelihood of detecting material misstatements Alqudah et al. (2023).

The effectiveness of internal auditors significantly influences the planning stage. Factors such as auditor competency, experience, and external incentives can impact planning depth, risk identification, and the development of appropriate audit procedures Alqudah et al. (2023). Effective planning also requires clear objectives, defined timelines, and collaboration with relevant stakeholders Alqudah et al. (2023); Mentz et al. (2018). Overall, planning forms the foundation for the reliability and effectiveness of the entire audit process.

2.2.1.2 Collecting and Evaluating Evidence

After planning, auditors proceed to collect and evaluate evidence to verify the accuracy of financial and operational information Mentz et al. (2018). Evidence may be obtained through inspection of records, observation of processes, inquiries with management and staff, and analytical procedures used to identify trends and anomalies Mentz et al. (2018). The evaluation process requires assessing the relevance, reliability, and sufficiency of the evidence to support audit conclusions Alqudah et al. (2023); Mentz et al. (2018).

The effectiveness of this stage depends heavily on auditors' skills, competence, and motivation, as well as the availability of organizational support and adequate resources Alqudah et al. (2023). When auditors possess the necessary expertise and operate within a supportive environment, they are better able to identify misstatements, assess risks accurately, and ensure that appropriate procedures are applied and reliable evidence is obtained Alqudah et al. (2023); Mentz et al. (2018).

2.2.1.3 Forming Conclusions and Reporting

In the final stage, auditors synthesize the collected evidence to form conclusions regarding the accuracy, completeness, and fairness of financial and operational information Mentz et al. (2018). These conclusions must be clear, evidence-based, and properly documented to ensure stakeholders can rely on the audit outcomes Mentz et al. (2018). The results are communicated through audit reports, which summarize findings, highlight issues, and provide actionable recommendations for improvement Alqudah et al. (2023); Mentz et al. (2018). The quality of conclusions and reporting depends on effective planning and thorough evaluation of evidence Alqudah et al. (2023). By integrating insights from earlier stages, auditors can produce reports that are credible, accurate, and useful for decision-making Alqudah et al. (2023). Consequently, reporting quality

reflects the overall strength and effectiveness of the auditing process Alqudah et al. (2023);Mentz et al. (2018).

1.1.1. Use Cases

[Provide a use-case diagram that shows the proper use of business process] Use: [Draw.io](#)

1.1.2. Business Process Diagram (BPMN)

[Provide a BPMN that helps you visualize your conceptual framework]

Use: <https://camunda.com/>

1.1.3. User Stories

[Create some user stories and split the business process into different epics to dive narrower into context]

Requirement ID	Epic	User Story Summary
PLN-01	Audit Planning	As an audit manager, I want the system to analyze transaction data using interpretable ML-based risk scoring and anomaly detection so that high-risk audit areas can be identified clearly and efficiently.
PLN-02	Audit Planning	As an audit manager, I want transactions to be automatically prioritized based on AI-generated risk levels so that audit resources can focus on the most critical cases first.
EVD-01	Evidence Gathering	As an internal auditor, I want the system to visualize transaction patterns, trends, and anomalies through interactive dashboards so that I can analyze audit evidence more efficiently.
EVD-02	Evidence Gathering	As a compliance auditor, I want the system to provide NLP-generated summaries and explainable AI insights alongside audit checks so that AI-supported findings can be reviewed and validated clearly.

EVD-03	Evidence Gathering	As a forensic auditor, I want suspicious transactions to be automatically flagged with clear anomaly explanations and warning indicators so that potential fraud cases can be investigated effectively.
EXE-01	Audit Execution	As an audit manager, I want to monitor audit progress, reviewed transactions, and remaining high-risk cases through real-time analytics dashboards so that audit priorities can be adjusted dynamically.
EXE-02	Audit Execution	As an internal auditor, I want the system to generate concise AI-supported summaries and key insights from audit data so that irregularities and important patterns can be identified quickly.
RPT-01	Reporting	As an auditor, I want the system to generate structured audit reports containing summarized findings, detected anomalies, and AI-generated insights so that audit results are communicated clearly and consistently.
RPT-02	Reporting	As an audit manager, I want the system to provide editable AI-generated recommendations based on identified risks so that final audit decisions remain under human review and control.

Field Requirements / Business Rules

[Provide some fields that shows up on the interface, and some business rules that limits the use within the product]

Module	Related User Stories	Field Requirements
Audit Planning	PLN-01, PLN-02	Transaction ID, Transaction Amount, Transaction Date, Risk Score (AI-generated), Risk Level (Low / Medium / High), Transaction Category, Priority Level, Status (Reviewed /Pending)
Evidence Gathering	EVD-01, EVD-02, EVD-03	Transaction ID, Anomaly Flag (Yes / No), Anomaly Type, Audit Notes, Audit Check Status (Completed /

		Pending), AI Explanation
Audit Execution	EXE-01, EXE-02	Audit Progress (%), Number of Transactions Reviewed, Number of High-Risk Transactions Remaining, Key Insights Summary(AI-generated), Risk Trend Indicator (Increasing / Decreasing)
Reporting	RPT-01, RPT-02	Report Title, Audit Period (Start Date – End Date), Summary of Findings (AI-generated), List of Detected Anomalies, Risk Distribution (% High / Medium / Low), Recommendations (AI-generated + editable), Auditor Comments

Business Rules

Rule ID	Business Rule
BR-01	Risk Score must be automatically generated by the system within a range of 0–100 and cannot be manually entered.
BR-02	Transactions with a Risk Score greater than 75 must be automatically classified as High Risk.
BR-03	High-risk transactions must be prioritized and displayed at the top of transaction lists.
BR-04	AI-generated outputs (e.g., Risk Score, AI Explanation, AI Summaries) must be read-only and cannot be manually modified by users.
BR-05	Transactions flagged as anomalies must display a clear visual indicator (e.g.,

	warning icon) in the interface.
BR-06	Audit notes must be saved before a transaction's audit check status can be marked as Completed.
BR-07	Audit progress must be automatically updated based on completed audit checks and must not exceed 100%.
BR-08	Audit reports can only be generated after the audit execution phase is completed.

Wireframe

[Provide a link to the interface created as an example of what is expected to be shown]

Use: [bolt.new](#)

The complete enhanced prototype can be accessed through the following Figma link:

<https://www.figma.com/make/iXjeazxvSQd3eiWQmFAgPp/Enhanced-AI-in-auditing?t=8UvyaqySnm8JPoIB-20&fullscreen=1>

Test Cases

[Provide some test cases to check later if the solution created is viable or did some test cases not pass]

Test Case ID	Test Scenario	Test Steps	Expected Result
PLN-01	Analyze and identify high-risk areas in transaction data	Log in as Audit Manager. Navigate to Audit Planning dashboard. Upload or load dataset. Trigger AI analysis. View results.	System assigns risk scores using classification models and clustering; high-risk areas are highlighted clearly.

PLN-02	Prioritize transactions based on AI risk scoring	Log in as Audit Manager. Navigate to Audit Planning. View analyzed transactions. Apply sorting or high-risk filter.	Transactions are ranked by risk score; high-risk transactions appear at the top.
EVD-01	View clustered and visualized transaction data	Log in as Internal Auditor. Navigate to Evidence Gathering page. Open dataset. View clusters and visualizations.	Transactions are grouped into clusters with visual patterns, trends, and anomalies displayed.
EVD-02	Record audit checks with AI-generated insights	Log in as Compliance Auditor. Navigate to Evidence Gathering. Select transaction. Add notes. View AI summary. Mark check completed.	Audit notes are saved; NLP summaries and explanations are displayed; status updates successfully.
EVD-03	Detect and flag suspicious transactions	Log in as Forensic Auditor. Navigate to Evidence Gathering. Load dataset. Run anomaly detection.	System flags suspicious transactions and displays anomaly indicators and types.
EXE-01	Monitor audit progress with AI risk indicators	Log in as Audit Manager. Navigate to Audit Execution. Perform audit checks. Monitor dashboard.	Audit progress updates in real time with AI risk indicators and high-risk counts.
EXE-02	Generate summaries and detect patterns	Log in as Internal Auditor. Navigate to Audit Execution. Analyze data. View summaries.	System generates NLP summaries and highlights patterns using clustering techniques.

RPT-01	Generate structured audit report	Log in as Auditor. Navigate to Reporting. Select audit period. Click generate report.	System produces structured report including findings, anomalies, and AI insights.
RPT-02	Add AI-based recommendations	Log in as Audit Manager. Navigate to Reporting. Open report. Review recommendations. Edit or confirm.	System provides predictive AI recommendations that can be reviewed and finalized.
